## **PART I: TIME-INTEGRATED SYNCHROTRON- RADIATION SPECTROSCOPY**

<b>1 Introduction to Nuclear Resonant Scattering of Synchrotron Radiation</b>	<b>15</b>
1.1 Properties of Synchrotron Radiation . . . . .	18
1.2 Time Differential Synchrotron-Radiation Spectroscopy . . .	20
1.3 Time-Integrated Synchrotron-Radiation Spectroscopy . . .	24
1.4 Guide through Following Chapters . . . . .	25
<b>2 Third Generation Synchrotrons</b>	<b>27</b>
2.1 The Advanced Photon Source . . . . .	28
2.2 Nuclear Resonance Beamline . . . . .	34
2.2.1 Beamline Components . . . . .	36

---

<b>3</b>	<b>Time-Integrated Synchrotron-Radiation Spectroscopy</b>	<b>43</b>
3.1	Description of the Method . . . . .	44
3.2	Theory of TISRS . . . . .	47
3.2.1	Resonant Scattering on a Bound Nucleus . . . . .	47
3.2.2	Resonant Forward Scattering by an Ensemble of Nuclei	52
3.2.3	TISRS Intensity . . . . .	54
3.3	Simulations . . . . .	56
3.3.1	Single-Line . . . . .	57
3.3.2	Magnetic Interaction . . . . .	58
<b>4</b>	<b>TISRS with Time Slicing</b>	<b>63</b>
4.1	Experiment with Time Slicing . . . . .	64
4.1.1	Experimental Setup . . . . .	64
4.1.2	Electronics Setup . . . . .	65
4.1.3	Results . . . . .	67
4.2	Discussion . . . . .	69
4.2.1	Sensitivity to Time Slicing . . . . .	69
4.2.2	Comparison with Mössbauer Spectroscopy . . . . .	74
4.3	Conclusion . . . . .	81

---

<b>5</b>	<b>TISRS with Crossed Polarizer and Analyzer</b>	<b>83</b>
5.1	Implementation of the Crossed Polarizer and Analyzer . . .	84
5.2	Experiment with Polarizer/Analyzer . . . . .	86
5.2.1	Experimental Details . . . . .	86
5.2.2	Result . . . . .	87
5.3	Discussion . . . . .	89
5.3.1	Qualitative comparison between TISRS and TDSRS	89
5.3.2	Use of polarizer and analyzer in TISRS . . . . .	90
5.4	Conclusion . . . . .	92
<b>6</b>	<b>Possible Improvements</b>	<b>93</b>
6.1	Nuclear Monochromator . . . . .	94
6.1.1	Application of a Nuclear Monochromator . . . . .	98
6.1.2	Conclusion . . . . .	101
6.2	Ultrafast Shutter . . . . .	102
6.3	Stacked Detectors . . . . .	102
6.4	X-ray Interferometer . . . . .	103
6.4.1	Single-line Sample . . . . .	105
6.4.2	Sample Submitted to Hyperfine Interaction . . . . .	107
6.4.3	Conclusion . . . . .	108
<b>7</b>	<b>Conclusions</b>	<b>109</b>

---

**PART II: NUCLEAR EMISSION HOLOGRAPHY**

<b>8</b>	<b>Introduction to Nuclear Holography</b>	<b>113</b>
8.1	From Optical to Nuclear Holography . . . . .	115
<b>9</b>	<b>Quantum Mechanical Theory of the Formation of a Nuclear Emission Hologram</b>	<b>119</b>
9.1	General Formalism . . . . .	120
9.2	Fundamental Equations . . . . .	122
9.3	Approximate Solution . . . . .	125
<b>10</b>	<b>Holographic Image</b>	<b>129</b>
10.1	Contrast Function . . . . .	130
10.1.1	Properties of the Contrast Function . . . . .	131
10.2	Simulations for a Bcc Lattice of $^{57}\text{Fe}$ . . . . .	134
10.3	Low-pass Filtering . . . . .	135
10.3.1	Filtering Procedure . . . . .	137
10.3.2	Applying Low-pass Filtering to Simulations . . . . .	138
10.4	Discussion . . . . .	140

---

<b>11 Nuclear Emission Holography</b>	<b>143</b>
11.1 Sample Preparation . . . . .	145
11.2 Recording of Hologram . . . . .	148
11.2.1 Data Acquisition Time . . . . .	149
11.3 Reconstruction . . . . .	151
<b>12 Conclusions</b>	<b>155</b>

## APPENDICES

<b>A Simulation program</b>	<b>159</b>
<b>B Calculations</b>	<b>165</b>
B.1 Derivation of the Fundamental Equations . . . . .	165
B.2 Single Scattering Approximation . . . . .	169
B.3 Solution in Time Domain . . . . .	174
B.4 Recorded Intensity . . . . .	176
<b>C Nederlandse Samenvatting</b>	<b>179</b>

# Preface

Coherence plays an important role in the interaction of  $\gamma$ -radiation with nuclei. The basic concept is that a single photon, when it interacts with an ensemble of nuclei, can follow several quantum mechanical paths.

Two kinds of coherence can be distinguished. First of all, there is spatial coherence between different nuclei in the sample. When a photon of right energy falls onto an ensemble of identical nuclei, it can be resonantly scattered by each one of these nuclei. According to quantum mechanics, it is impossible to distinguish between different scattering paths and to determine on which particular nucleus the scattering actually happened. The excitation, created by absorption of a single photon, is in fact spread out over the whole ensemble. One could say that all nuclei are partly excited. This delocalized, intermediate state is called a nuclear exciton. It is a coherent superposition of states in which one nucleus is excited and all the others are in the ground state. When the nuclear exciton decays, the waves emitted by all nuclei will interfere. In forward and Bragg direction the interference is constructive and the radiative intensity is enhanced compared to that of a single nucleus.

There is also energy coherence which can happen inside a single nucleus or between different nuclei. When the incident  $\gamma$ -quantum has a broad energy spectrum, it can excite several nuclear transitions simultaneously. Again, there are different quantum mechanical paths that can interfere.

In this thesis two new techniques are worked out which are both based on the coherence with  $\gamma$ -radiation.

In a first part, time-integrated synchrotron-radiation spectroscopy is developed. It is a new hyperfine interaction technique which relies on both the spatial and energy coherence.

In a second part, nuclear emission holography is treated. This technique, which allows three-dimensional imaging of nuclei, is based on the spatial coherence of radiation emitted by nuclei inside the sample.
